INACAS

I like Camping.

Not all awnings are designed and manufactured to the same specification. At INACA, our range is conceived to fulfil the requirements of each caravanner. Before purchasing an awning it is important to think about the various features that might interest you.

We have stressed some of the features that should be considered in order for you to select the correct awning.

Spaciousness: The depth of awning you select is determined by the size of your pitch. The European standard in awning depth is 250cm. INACA also offers depths of 270cm, 300cm and even 350cm to provide suitable alternatives for every customer.

Materials: The canvas of an awning can be manufactured in many different types of material. At INACA we offer; Acrylic (strong and breathable), Polyester Acryl (breathable, acrylic touch and polyester advantages), Polyester PVA (lightweight, breathable and very durable) and Polyester PVC (very strong and easy to clean). All of these high quality materials are waterproof and resilient.

Mosquito netting and ventilation: For your comfort in warmer weather it is important that the awning is correctly ventilated. We offer awnings with mosquito netting in the side panel(s) coupled with ventilation in the upper central part of the front wall. Ventilation also serves to lessen undesired condensation. Awnings fabricated completely from Polyester PVC are more prone to excess condensation (non-breathable).

Windows and zip down covers: The composition of the panels along the front wall may vary according to the size of your awning and the model chosen. On certain models the windows will be provided with zip down covers, preserving the window material from adverse external weather conditions and offering additional privacy. **Estructuras.** Las estructuras de Campion Production están compuestas de acero de 25 mm. galvanizado en la parte exterior y también en el interior para evitar cualquier posibilidad de corrosión. INACA también ofrece estructuras de aluminio y de fibra de vidrio para alguno de sus modelos.

Frames: We supply high quality frames made by Campion with our awnings. Our standard frames are 25mm Ø galvanised steel. They are galvanised both from the outside and inside thus avoiding any chance of oxidation. INACA also offers lightweight frames in its range, including aluminium and top quality fibreglass (available only on certain models).

Fixing system: We supply the FIX-ON system from Campion as standard with most models. These specialised fixtures allow you to fit the awning to your caravan without any screws.

INACA shares with its associates the pride of using top quality materials and components throughout the manufacture of all our products.

The distinctive CONFIDENCE IN TEXTILES, tested for harmful substances, according to Ökotex Standard 100 guarantee that the materials used in our awnings (Sauleda and Ten Cate Technical Fabrics) are safe materials not hazardous for your health.

How to choose your awning?

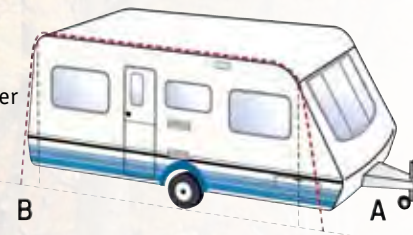

Inaca offers a wide range of awnings. Each of them has different performance qualities to satisfy every caravanner's specific needs. Therefore, it is very important to choose an awning that suits your needs. Do not hesitate to ask your distributors for advice. Their professional assessment will help you with your choice.

Which is the most suitable awning for your caravan?

When buying your awning, our distributors will need to know the Brand, Model, and Year of your caravan. If you are unsure about any of these facts, Inaca offers you a quick and efficient guide classifying the awning's size according to the perimeter of each caravan.

How to measure the perimeter of your caravan?

With your caravan on flat ground, measure your awning rail from floor to floor as shown by the red line in the diagram. By measuring the distance from A to B, you can have the perimeter of your caravan.

For instance:

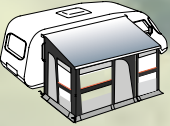

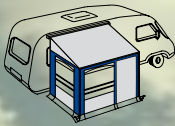

If your caravan has a perimeter of 944 cms (Measurement from A to B), the appropriate awning for you is V-950.

Some important suggestions:

- Always pay special attention at measuring the perimeter of your caravan; The correct election of the size you require is a determinant factor for the proper erection of your awning.
- According to the different sizes the distribution of the front panel may vary. Pay attention at the diagrams in order to avoid misunderstandings.
- Never pack your awning when wet.
- Never clean your awning with products that may damage the materials.
- When you use your PVC awning for the first time under rainy conditions, it is possible that the seams may leak initially. The problem will disappear when the stitching has swollen into place over the following days use.

All weights and measurements shown in this catalogue are approximate. INACA, SA reserves the right to make improvements/changes on the products. We want to thank to the Council of Sant Boi de Llobregat, to our partners and to everyone who has participated in the creation of this catalogue.
